Magnetic Field Accumulation and Destruction near Black Holes

Unstable Magnetospheric Interfaces and QPOs

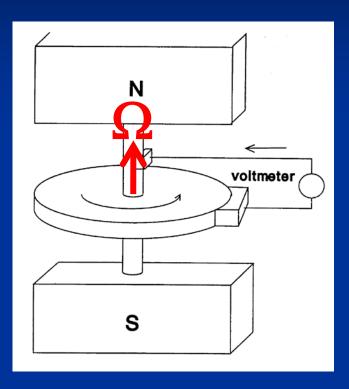

Summary

Black Hole (BH) Systems

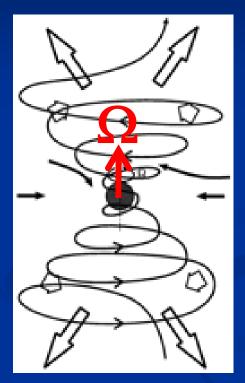

BH as Faraday Disk

(homopolar or unipolar generator)

Force =
$$q v \times B \propto V = IR$$

Power = $P = IV = I^2 R$
 $P \propto R B^2 \Omega^2$

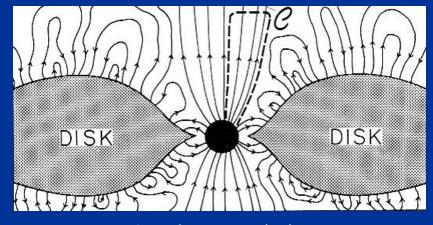

Membrane Paradigm: (Thorne et al.) $R = 4\pi/c \sim 377 \text{Ohms}$

Blandford & Znajek (1977) $P \propto B_r^2 \Omega_H^2$

Role of Magnetic Field / Flux

Weak Field MRI Disk + BZ Jet

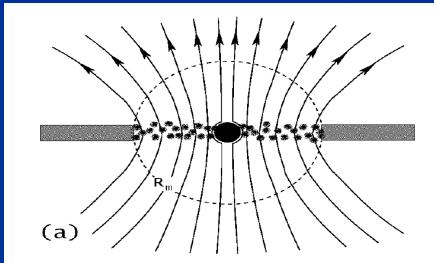

= Fine-Tuned Flux

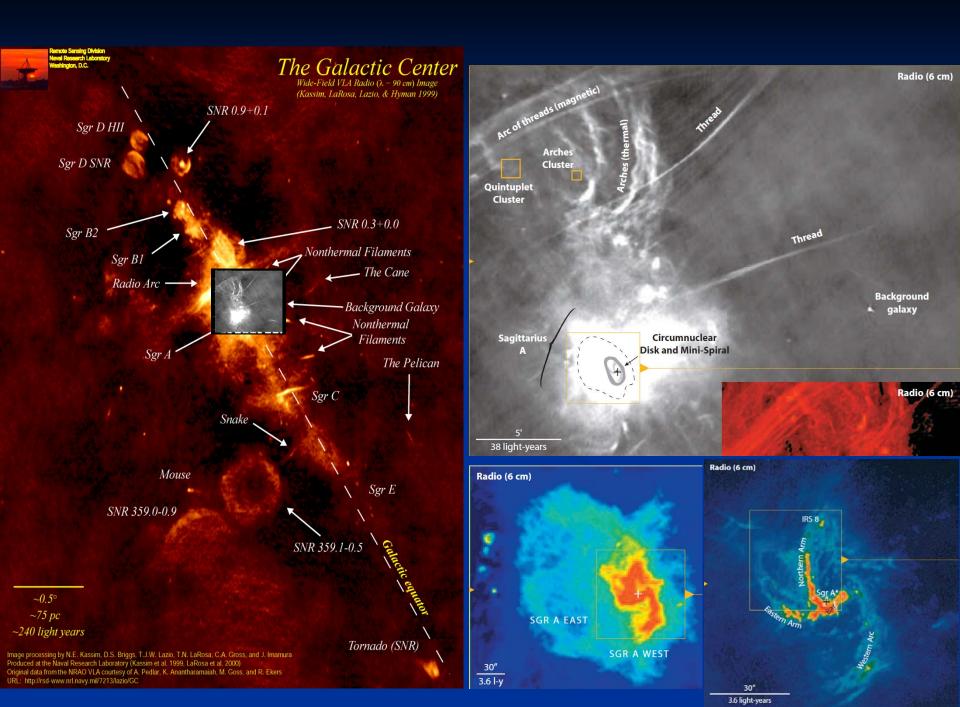

Blandford & Znajek (77) MacDonald & Thorne (82)

Balbus & Hawley (1991,1998)

Magnetically Arrested Disk = Flux in Force Balance

Znajek (76), Bisnovatyi-Kogan & Ruzmaikin (74,76), Narayan et al. (03), Reynolds et al. (06), Igumenshchev et al. (03)

How much Magnetic Flux?

- Coherent Flux near Galactic Nucleus:
 - $\Phi \sim 0.1~{
 m pc^2G}$ or greater Lang, C. C., Morris, M., & Echevarria, L. 1999, ApJ, 526, 727
- Magnetospheric Radius (McKinney, Tchekhovskoy, Blandford 2012):
 - 1) Mass Flux:

$$\Sigma = \dot{M}/(2\pi r \epsilon v_{\rm ff})$$
 $\dot{M} = \dot{M}_{\rm H} (r/r_g)^n$

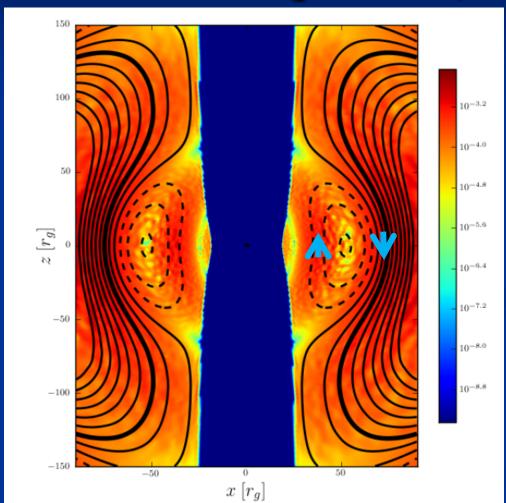

- 2) Gravity Balancing Field: $GM\Sigma/R^2 \sim 2B_RB_z/4\pi \sim B_z^2/2\pi$
- 3) Solve for Bz:

$$B_z \sim 10^5 \epsilon_{-1}^{-1/2} m_8^{-1/2} \dot{m}^{1/2} (r/r_g)^{-5/4+n/2} \text{ G}$$

- 4) Integrate Bz within r_m to get magnetic flux (Φ) within r_m .
- 5) Solve for $r_{\rm m}$: $r_m \sim r_g \left(12000 \left(\frac{3}{4} + \frac{n}{2}\right)\right)^{\frac{4}{3+2n}} \epsilon_{-1}^{\frac{2}{3+2n}} m_8^{-\frac{6}{3+2n}} \dot{m}_{\rm H}^{-\frac{2}{3+2n}} \left(\frac{\Phi}{0.1 {\rm pc}^2 {\rm G}}\right)^{\frac{4}{3+2n}}$

SgrA*:
$$r_{\rm m} \sim 10^7 r_{\rm g}$$
 (n=1)
M87: $r_{\rm m} \sim 10^2 r_{\rm g}$ (n=1)

GR-MHD Simulations of Disks with Lots of (poloidal) Magnetic Flux

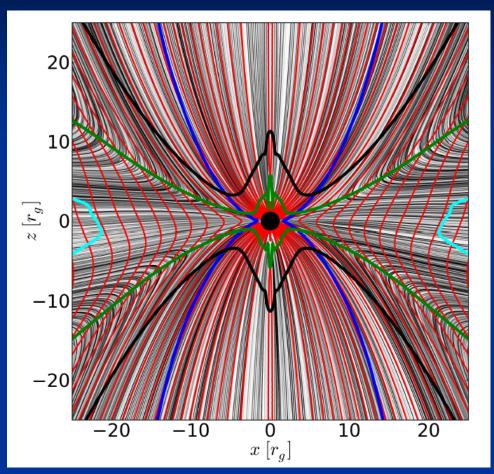

Physical Setup: Spin: a=0.94 Radiatively Inefficient Thick Disk

Numerical Setup: Fully 3D (no syms) KS Coords ~1E5M outer radius

EM Energy Density & Field Lines

Magnetically Choked Accretion Flow

Time-Azimuthal Average:

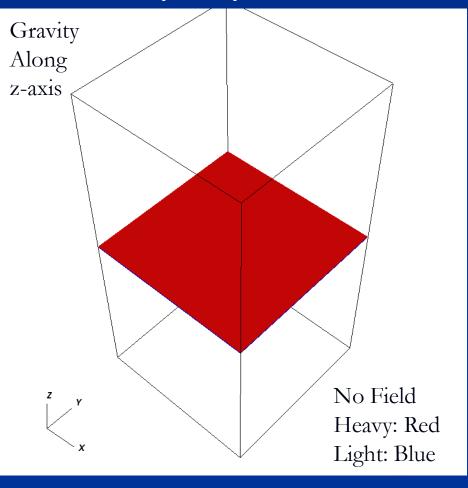

Red: Magnetic Field Lines

Gray: Velocity Stream Lines

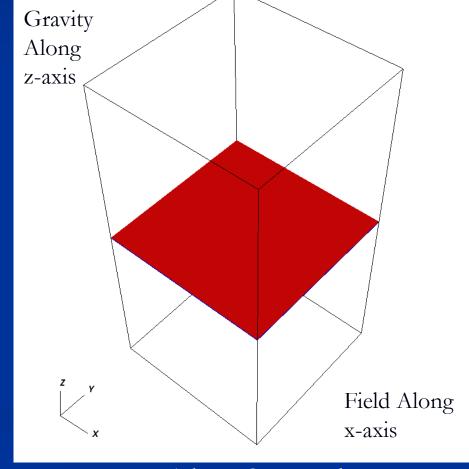

- Magnetic Flux Saturates to Natural Limit
- Force Balance between Ram/Gravity and Magnetic Flux
- MRI (magneto-rotational/Balbus-Hawley instability) suppressed!

Accretion Occurs through Magnetic Rayleigh-Taylor Modes

Hydrodynamics

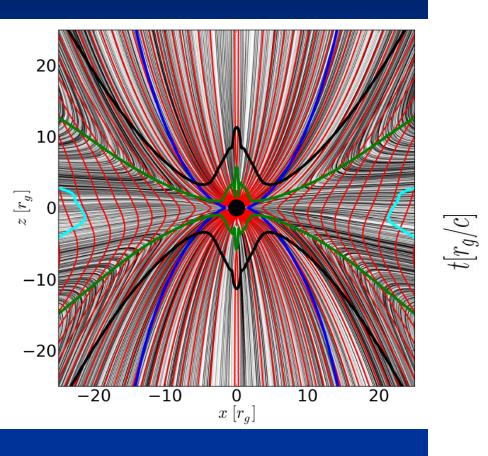

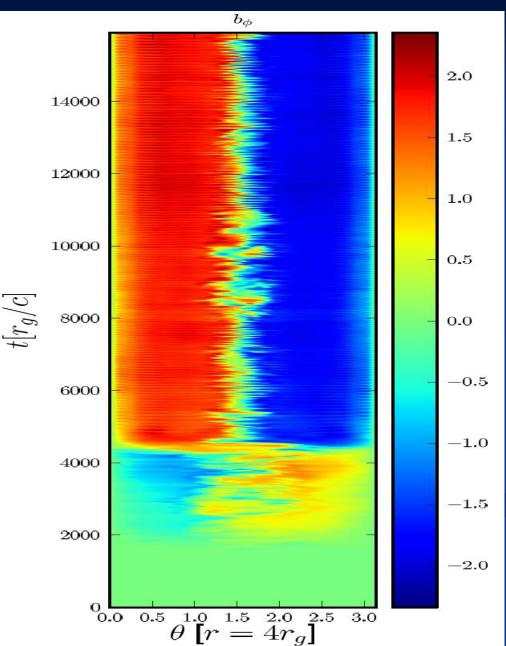

MagnetoHydrodynamics

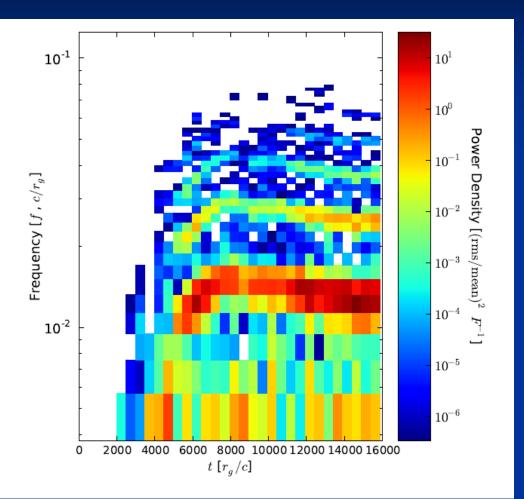

Athena, Stone et al.

Unstable Magnetospheric Interface & QPOs

Spectrogram of Field showing QPOs

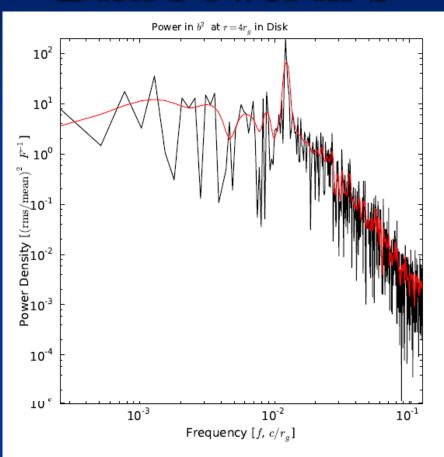

Magnetospheric Barriers to Accretion:

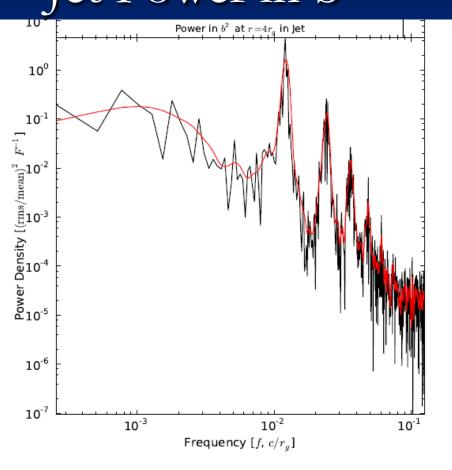

QPOs predicted by Li & Narayan (2004), Wu & Lai 2012).

Polar field as strong as disk inflow -> Interface is KH unstable

Like Flag Flapping in Wind

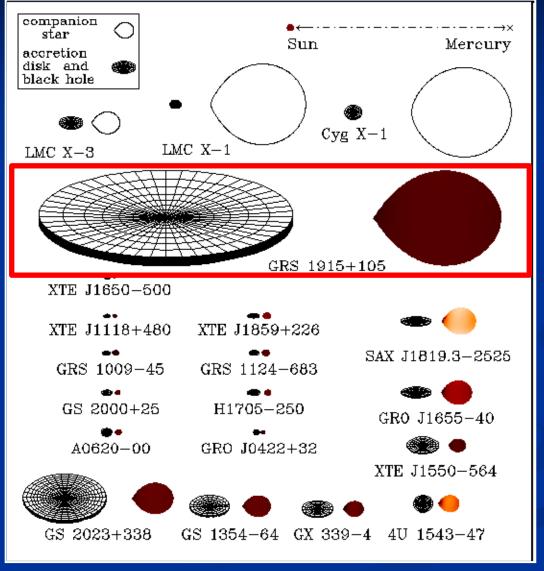

Temporal Power Density at r=4M Disk Power in b² Jet Power in b²

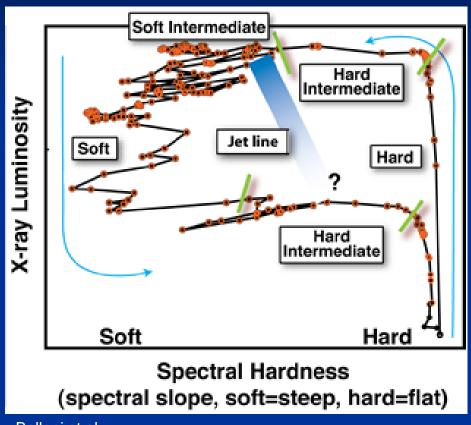

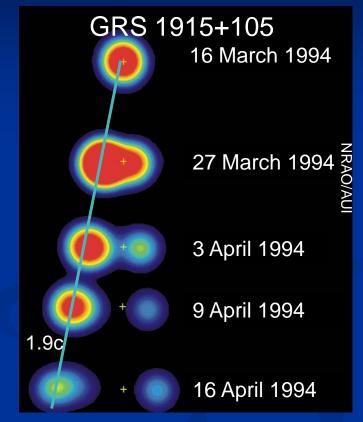

Jet-Disk Interface m-modes: $\tau \sim 70$ -140 M Same range as observed HFQPOs

BH X-Ray Binaries

BH X-Ray Binaries

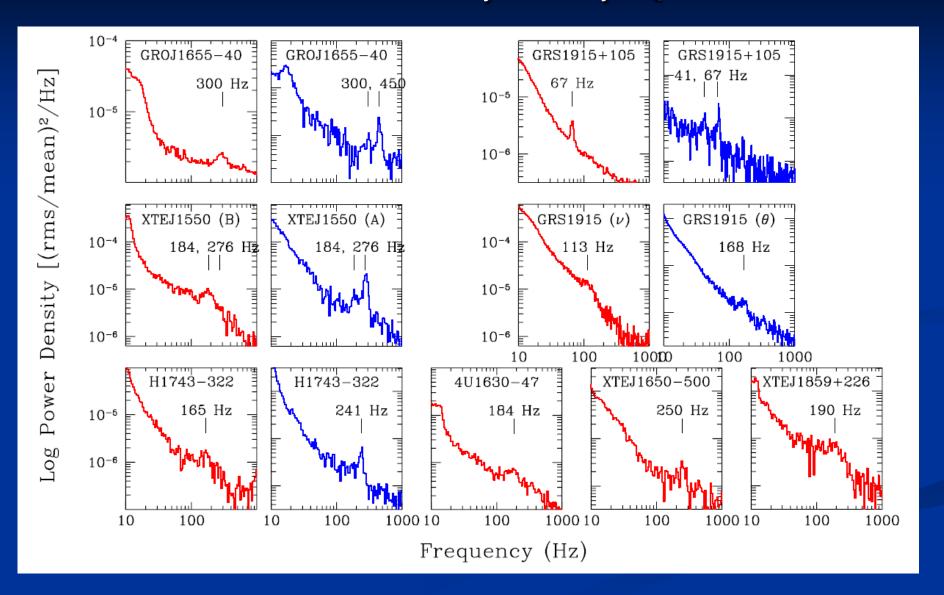

Mirabel & Rodriguez (1994,1999)

- Belloni et al.
- Mass Accretion Rate sets luminosity?
- But then how to explain case of 2 states at same luminosity?
- Why only QPOs and Jets in Intermediate State and not Soft?

Black Hole X-ray Binary QPOs

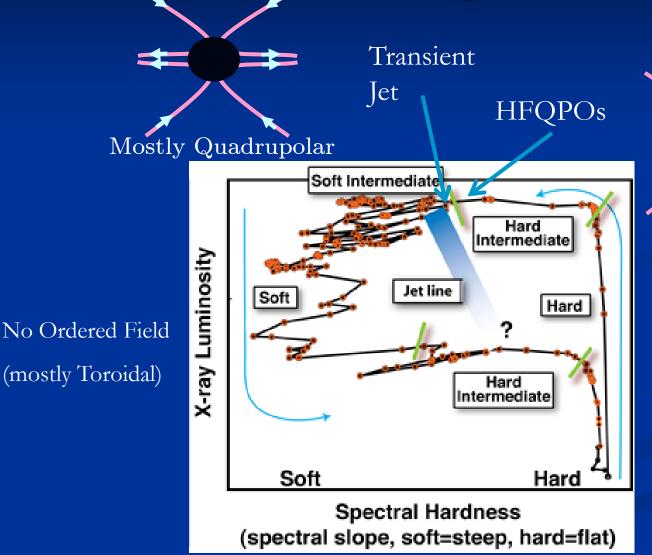

Black Hole X-ray Binary QPOs

 $\tau \sim 70-140 \text{ M} - \text{just like JD-QPO (a=0.6-0.98)}$

Origin of States, QPOs, and Transient Jet?

Mostly

Dipolar

Summary

- Magnetic Flux reaches Natural Saturation Point
- MRI is suppressed not standard disk picture!
- Can explain most powerful Jets
- Might explain why QPOs in certain (SPL) disk state

- 2 parameters strongly control disk state:
 - Mdot & Magnetic Flux
 - State Transitions, Transient Jet, and QPOs?
